NOTES

REINFORCEMENT STEEL IN CONCRETE FLOOR, TOEWALL, AND CUTOFF WALL TO BE 3/8" DIAMETER BARS PLACED AT CENTER OF SLAB AND SPACED ABOUT 12" C-C BOTH WAYS. ALL LONGITUDINAL BARS TO BE BENT INTO CUTOFF WALL AND TOEWALL. 6" X 6" NO. 6 WELDED WIRE MESH MAY BE SUBSTITUTED FOR BARS.

CONCRETE BLOCK WALLS TO BE REINFORCED BY PLACING HIGH TENSION STEEL WIRE MESH NO. 9 WIRE, SIMILAR TO CARTER-WATERS BLOX-MESH IN ALL HORIZONTAL BLOCK JOINTS. LAP WIRE MESH 6 INCHES AT ALL SPLICES. THE MESH SHALL BE LAPPED SIX INCHES AT JUNCTION OF SIDEWALLS WITH HEAD WALL SO AS TO EFFECTIVELY TIE THESE PARTS TOGETHER.

THE JOINT THICKNESS BETWEEN CONCRETE BLOCKS SHALL BE ABOUT 1/4 INCH. THE CONCRETE BLOCKS SHALL BE LAID WITH STAGGERED VERTICAL JOINTS AS SHOWN ON THE PLANS. THE OPENINGS IN THE BLOCKS SHALL BE ALIGNED VERTICALLY AND FILLED WITH CONCRETE GROUT. THE CONCRETE CUTOFF WALL AND TOEWALL ARE TO BE POURED AGAINST CONSOLIDATED MATERIAL.

NOTES

1. SELECT A PIPE SIZE THAT WILL PROVIDE A GREATER CAPACITY THAN IS REQUIRED TO DISCHARGE THE NORMAL STREAM USED WHEN IRRIGATING. TRY TO KEEP THE VELOCITY IN THE PIPE BELOW 3 FPS BASED ON NORMAL IRRIGATING STREAM.
2. WHEN THE CORRUGATED METAL PIPE DROP IS USED AT A DITCH CROSSING, INCREASE WIDTH OF TOP OF DAM AND DIMENSION L_2 BY 8'-0".
3. THE DROP (H) FOR ANY SPECIFIC STRUCTURE CAN BE INCREASED 3 INCHES BY PLACING THE TOP OF THE RISER PIPE 3 INCHES BELOW THE TOP OF THE CONCRETE FLOOR OF THE INLET. THE THICKNESS OF THE FLOOR SLAB ADJACENT TO THE PIPE SHOULD BE INCREASED 3 INCHES TO MAKE A WATERTIGHT CONNECTION WITH THE PIPE. THE INLET TO THE PIPE SHOULD BE ROUNDED TO A 3 INCH RADIUS TO SAVE FORMING AND IMPROVE THE EFFICIENCY OF THE INLET.
4. THE DROP STRUCTURE IS FORMED BY CUTTING A STANDARD LENGTH OF CORRUGATED METAL PIPE, WHICH IS MANUFACTURED IN MULTIPLES OF 2 FT. IN LENGTH, ON A 45° ANGLE AND WELDING THE CUT JOINTS TOGETHER TO FORM A 90° BEND. PIPE TO BE #6 GA. CORRUGATED METAL. JOINTS BETWEEN HORIZONTAL AND VERTICAL PIECES OF PIPE TO BE BUTT WELDED AND WATERTIGHT.
5. SIX INCH HAND PLACED RIP-RAP MAY BE SUBSTITUTED FOR CONCRETE SLAB.

NOMENCLATURE

Reinforcing steel (bars)	pounds	644	52	668	54	807	61

NOTES:

1. Main reinforcement to be 1/2" diameter and 5/8" diameter deformed bars, intermediate grade, spaced as indicated on plans. Lap 1/2" diameter bars 20 inches at splices and 5/8" diameter bars 26 inches at splices. All bars extending up from concrete floor, cutoff wall, and toe wall into concrete blocks shall be placed to match the holes in the concrete blocks. A minimum of 5/8 inch must be provided between face of holes in concrete block and sides of reinforcing bars to permit a good bond. Longitudinal bars in floor slab to be bent into toe wall and cutoff wall as shown on plans. Welded high tensile steel mesh of No. 9 wire containing two longitudinal bars, transverse bars on 16 inch centers, and diagonal bars similar to Carter-Meters Blok-Mesh shall be placed in all horizontal joints between layers of concrete blocks.
2. The joint thickness between concrete blocks shall be about 1/2 inch. The mortar for laying the concrete blocks shall be one part Portland cement to three parts sand with five pounds of hydrated lime per sack of cement added.
3. The concrete blocks shall be laid with broken vertical joints as shown on the drawing. The openings in the blocks shall be lined vertically to facilitate the placing of the vertical bars and the filling of the holes with concrete grout. Special care shall be taken when laying blocks; not to partially clog the holes in the blocks with mortar. The holes shall be cleaned with a rounded stick or other suitable device before the mortar has hardened.
4. After the concrete block walls have been laid about five blocks high, the vertical steel shall be inserted in the holes and the holes shall be filled with concrete grout consisting of one part Portland cement to three parts sand with a total water content of 6.5 gallons per sack of cement. After the grout has set for twelve hours, the balance of the wall shall be laid by threading the blocks over the vertical bars. If the lift of the blocks is too high, this can be reduced by splicing the vertical bars.
5. The concrete cutoff and toe walls are to be poured against undisturbed earth where possible.
6. Place three 9 inch diameter pipes six inches long through end sill with flow line at top of floor elevation. Place one pipe on center line and one midway between each side wall and longitudinal sill.
7. Place gravel drain back of side walls as shown on plans. Slope bottom of drains on 1% grade towards lower wing walls. Place one 2 inch diameter pipe weep hole through each lower wing wall at center line of gravel drain with flow line of pipe at elevation of bottom of gravel drain at back of lower wing wall. Place gravel drain back of headwall with weep holes as shown.
8. Length of spillway crest (W) not to exceed 19'-3". Where width of gully is about equal to the spillway crest length (W) and where banks are composed of heavy soil that will stand on steep slopes, lower wing walls may be shortened or eliminated, but gravel drains shall be installed in accordance with drawing. In locations where alkali is present, paint back of all concrete block walls with two coats of emulsified asphalt.

TABLE No. 1 - DIMENSIONS AND QUANTITIES

DIMENSIONS								QUANTITIES			
H	D ₁	L ₁	L ₂	L ₃	D ₀	P	t	W = 6'-0"		Add for each additional foot in spill- way length (W) over W = 6'-0"	
								Concrete Cu. yds.	Reinforcing steel Pounds	Concrete Cu. yds.	Reinforcing steel Pounds
3'-0"	1'-6"	4'-0"	4'-6"	2'-6"	2'-0"	5"	6"	4.26	357	0.28	19
	2'-0"	5'-3"	5'-9"	3'-3"	2'-9"	6"	6"	5.23	450	0.32	23
4'-0"	1'-6"	4'-6"	4'-6"	2'-6"	2'-0"	5"	6"	4.83	414	0.32	23
	2'-0"	5'-9"	5'-9"	3'-3"	2'-9"	6"	6"	6.17	515	0.35	26
	2'-6"	7'-0"	7'-0"	3'-10"	3'-4"	9"	6"	7.78	680	0.40	31
	3'-0"	8'-0"	8'-0"	4'-6"	4'-0"	11"	7"	9.85	812	0.45	33
5'-0"	1'-6"	5'-0"	4'-6"	3'-2"	2'-8"	5"	6"	5.61	519	0.35	30
	2'-0"	6'-3"	5'-9"	3'-3"	2'-9"	6"	7"	7.26	587	0.41	32
	2'-6"	7'-6"	7'-0"	3'-10"	3'-4"	9"	7"	9.06	770	0.46	36
	3'-0"	8'-6"	8'-0"	4'-6"	4'-0"	11"	8"	11.44	933	0.52	40

NOTE:

Quantity of gravel required for drains back of sidewalls varies from 12 cu. feet for smallest structure listed in table to 21 cu. feet for largest.

NOTES:

1. Reinforcement to be 1/2" dia. deformed bars, intermediate grade. Lap bars 20" at splices. All steel spacings not shown in table are 12" centers both ways. All horizontal bars are spaced at 12" centers. Longitudinal bars in floor slab to be bent into the toe wall and headwall as shown on plans. Vertical bars in sidewalls to be bent into floor slab a distance of 3'-0". Horizontal bars in headwall above bottom of floor to be bent into sidewalls a distance of 1'-0". Horizontal bars in upper wing walls above bottom of floor to be bent into sidewalls a distance of 2'-0". Horizontal bars in upper wing walls below bottom of floor to be bent into the cutoff wall a distance of 2'-0".
2. Cutoff and toe walls to be poured against undisturbed earth where possible.
3. Place three 2" dia. pipes through end sill with flow lines at the top of floor elevation. Place one pipe on centerline and one midway between each sidewall and longitudinal sill.
4. Place 2" dia. weep holes spaced about 4'-0" c-c through sidewalls with flow line at same elevation as top of end sill.
5. Place gravel drain back of sidewalls as shown on plans.
6. Use construction joints when necessary formed with beveled 2 X 4's.

NOMENCLATURE

H	Height of crest of spillway above top of end sill
D ₁	Height of top of sidewall and upper wing wall above crest of spillway
D ₀	Height of lower end of sidewall above top of end sill
d	Height of water above crest of spillway at design flow
W	Length of spillway crest
L ₁	Distance between downstream face of headwall and upstream top edge of end sill
L ₂	Length of upper wing walls = $2.31 D_1 + 12" \pm$
L ₃	Length of lower wing walls = $D_0 + 6"$
t	Thickness of headwall and sidewalls
P	Height of end sill
X	Cutoff point from top of headwall for every other vertical bar in headwall
Y	Cutoff point above top of floor for every other vertical bar in sidewall when spacing does not exceed 9"
b	Distance inside face of sidewall to centerline of longitudinal sill
Q	Discharge in c.f.s.

TABLE OF SPILLWAY CAPACITIES IN C.F.S.

D ₁	LENGTH OF SPILLWAY OPENING "W" IN FEET							
	6	8	10	12	14	16	18	20
1'-6"	17.4	23.4	29.4	35.4	41.4	47.4	53.4	59.4
2'-0"	31.4	42.4	53.5	64.5	75.5	86.5	97.5	109.0
2'-6"	47.5	64.5	81.4	98.4	115.0	132.0	149.0	166.0
3'-0"	65.2	88.9	113.0	136.0	160.0	184.0	208.0	231.0

$d = D_1 - 6"$ freeboard
Capacity of spillway $Q = 3.0(W - 0.2d)d^{3/2}$ c.f.s.
